

B.Ed. 1st Semester — Course 1.1.1 (2nd Half)

Childhood and Growing up: Aspects of Development

Question Bank (2020–2024) with Model Answers

Repeated questions are listed once with all years noted. Group A ≈ 50 words, Group B ≈ 150 words (point form), Group C ≈ 300 words.

GROUP A — 2 Marks Each (any 5 asked, ~50 words)

1. What is meant by 'Emotion'? (2022, 2024)

Emotion is a mental and physical state that includes feelings like joy, anger, fear, or sadness. It is caused by events, thoughts, or experiences, and it affects how a person thinks, behaves, and relates to others.

2. State the importance of emotion in education. (2021)

Emotion affects how well a student learns. Positive emotions like interest and joy improve attention and memory, while negative emotions like fear or anxiety can block learning. Teachers should create a happy, safe classroom to support both learning and emotional health.

3. Write any two educational implications of 'Attitude'. (2020, 2022, 2023, 2024)

- A positive attitude towards learning increases motivation and active participation in class.
- Attitude shapes classroom behavior — students with a good attitude cooperate more, so teachers should work to build positive attitudes in students.

4. What is 'locus of control'? (2020)

Locus of control is a person's belief about what controls their success or failure. In "internal" locus, a person believes their own effort matters most. In "external" locus, a person believes luck or outside forces are responsible.

5. State any two components of 'Creativity'. (2020, 2022)

- **Originality** – the ability to produce new and unique ideas.
- **Fluency** – the ability to produce many ideas or solutions quickly for a given problem.

6. What do you mean by 'Creativity'? / Define Creativity. (2020, 2024)

Creativity is the ability to produce new, original, and useful ideas, solutions, or products. It involves imagination and thinking beyond usual patterns to solve problems or create something valuable in art, science, or daily life.

7. What is 'Acquired interest'? (2020)

Acquired interest is an interest that a person develops over time through learning, exposure, or experience, rather than one they are born with. For example, a student may develop interest in music after repeated exposure to it in school.

8. What is the meaning of 'Instinct'? (2020, 2023)

Instinct is an inborn, natural tendency to act in a certain way without learning or thinking, common to all members of a species. Examples include a baby's sucking reflex or fear of loud sounds.

9. What is meant by Intelligence Quotient? (2021, 2024)

Intelligence Quotient (IQ) is a number that shows a person's mental ability compared to others of the same age. It is calculated using the formula: $IQ = (\text{Mental Age} \div \text{Chronological Age}) \times 100$.

10. What is 'Self-actualization' need? (2021)

Self-actualization, the highest need in Maslow's theory, is the desire to realize one's full potential — becoming the best version of oneself through growth, creativity, and achieving personal goals, after basic needs are met.

11. Distinguish between 'Motivation' and 'Drives'. (2021)

Motivation is the overall force that directs behavior towards a goal, and can be influenced by both internal and external factors. Drives are specific internal states (like hunger or thirst) caused by a biological need, which push a person to act.

12. State two characteristics of attitude. (2021)

- Attitude is learned, not inborn — it is formed through experience and environment.
- Attitude is fairly stable but can be changed over time through new experiences or persuasion.

13. What is Extrinsic Motivation? (2021, 2024)

Extrinsic motivation is the drive to do something because of outside rewards or pressures, such as marks, praise, prizes, or fear of punishment, rather than personal interest or enjoyment in the task itself.

14. Explain the relationship between attention and interest. (2021)

Attention and interest are closely linked — a person naturally pays more attention to things they find interesting. Greater interest leads to stronger, longer attention, while attention on a topic can also help build interest in it over time.

15. What is 'curiosity'? (2022)

Curiosity is the natural desire to explore, learn, and gain new knowledge or experiences. It makes a person ask questions and investigate, and it plays a key role in driving learning and discovery.

16. What is 'span of attention'? (2022)

Span of attention refers to the number of items or objects a person can notice and grasp at a single glance, in a short period of time. It shows the limit of how much a person can attend to at once.

17. Distinguish between verbal and non-verbal test of intelligence. (2022, 2024)

Verbal tests use language — words, numbers, and reading — to measure intelligence, and need good language skills. Non-verbal tests use pictures, diagrams, or objects instead of words, making them useful for testing people with language or hearing difficulties.

18. What is Intrinsic Motivation? (2022, 2023)

Intrinsic motivation is the drive to do something because of personal interest, enjoyment, or satisfaction gained from the activity itself, rather than for any outside reward. For example, reading a book purely for pleasure.

19. What is meant by 'Fluctuation of Attention'? (2023, 2024)

Fluctuation of attention means that a person's attention naturally rises and falls over short periods, even while focusing on one task. It cannot stay fixed at the same level continuously and moves between sharper and weaker focus.

20. Write the elements of 'Emotional Intelligence'. (2023)

The main elements of Emotional Intelligence are: self-awareness, self-regulation, motivation, empathy, and social skills. Together, these help a person understand and manage their own emotions and understand and relate well to others' emotions.

21. Establish the relation between 'Intelligence Quotient' and 'M.A'. (2023)

Mental Age (M.A.) shows a person's level of mental development, while Intelligence Quotient (IQ) compares this to their actual age (Chronological Age). The formula $IQ = (M.A. \div C.A.) \times 100$ shows that IQ depends directly on M.A.

22. Write 4 factors which hinder the nurturance of creativity in classroom. (2023)

- Too much focus on strict rules and rote memorization.
 - Fear of making mistakes or being criticized.
 - Lack of time for free thinking and exploration.
 - Rigid, one-way teaching methods with no room for questions or new ideas.
-

GROUP B – 5 Marks Each (any 3 asked, ~150 words, point form)

1. Write a short note on 'Verbal intelligence test' / Write about 'Verbal tests of Intelligence'. (2020, 2023)

- Verbal intelligence tests measure mental ability using **language** – words, reading, numbers, and vocabulary.
- Test-takers answer through spoken or written words, not pictures or objects.
- Common examples: Stanford-Binet Test and the verbal part of the Wechsler Scale.
- **Strengths:** easy to administer to groups, useful for school-related ability assessment.
- **Limitations:** unsuitable for people with poor language skills, hearing problems, or different native languages, since results may be affected by language ability rather than true intelligence.
- Often used alongside non-verbal tests for a fairer, fuller picture of a person's intelligence.

2. How can multiple intelligences be applied in the teaching-learning process? (2020)

- Gardner's theory says people have different types of intelligence (linguistic, logical, spatial, musical, bodily, interpersonal, intrapersonal, naturalistic).
- Teachers should use **varied teaching methods** – stories for linguistic learners, puzzles for logical learners, music and art for others.
- Let students show what they learn in different ways (drawing, acting, writing, building models).
- Group work helps interpersonal learners; quiet reflection time helps intrapersonal learners.
- This approach makes learning inclusive and helps every student succeed using their own strength.

3. Write a short note on the three causal dimensions in Weiner's Attribution theory of motivation. (2020)

- Weiner said people explain success/failure using three dimensions:
 - **Locus of control:** whether the cause is internal (own ability/effort) or external (luck, task difficulty).
 - **Stability:** whether the cause is stable (ability) or changes over time (effort, mood).
 - **Controllability:** whether the person can control the cause (effort) or not (luck).
- These explanations affect a student's future motivation, confidence, and emotional reaction to success or failure.

4. How do you identify creative students? Mention ways of nurturing creativity / five characteristics of a creative learner / features of creativity. (2020, 2021, 2023, 2024)

- **Signs of a creative student:**
 - Asks many questions and shows curiosity.

- Gives original, unusual answers or ideas.
- Enjoys imaginative play, art, or storytelling.
- Is flexible in thinking and open to new approaches.
- Shows independence and is not afraid to try new things.
- **Ways to nurture creativity:**
 - Encourage open-ended questions and free thinking.
 - Avoid criticizing wrong or unusual answers.
 - Give time and freedom for exploration and project work.
 - Use group activities, brainstorming, and art-based learning.

5. Differentiate between additional (volitional) and non-additional (non-volitional) attention. (2020, 2021)

- **Volitional (voluntary) attention:** given on purpose, with effort and will power – e.g., focusing on a boring lecture through self-control.
- **Non-volitional (involuntary) attention:** happens automatically, without effort, usually pulled by something interesting or sudden – e.g., turning towards a loud noise.
- Volitional attention needs interest and motivation to sustain; non-volitional attention is natural and needs no effort.
- Teachers should use interesting material to turn non-volitional attention into steady, volitional attention for better learning.

6. Discuss the determinants of attention (objective/subjective) with their application in education. (2021, 2023, 2024)

- **Objective (external) determinants:** size, intensity, movement, novelty, and contrast of the stimulus attract attention.
- **Subjective (internal) determinants:** interest, motivation, mood, and past experience of the learner affect what they attend to.
- **In education:**
 - Use bright visuals, movement, and varied tone of voice to gain attention (objective).
 - Connect lessons to students' interests and needs to hold attention (subjective).
 - Avoid monotony; change teaching methods to prevent attention fatigue.

7. Explain different strategies for motivating students to learning. (2021)

- Set clear, achievable goals so students know what to work towards.
- Give regular praise and positive feedback for effort, not just results.
- Use rewards carefully to build both extrinsic and intrinsic motivation.
- Make lessons relevant and interesting by connecting them to real life.
- Create a safe, encouraging classroom where mistakes are seen as part of learning.
- Use group work and healthy competition to boost engagement.

8. What is intelligence? Explain the relationship between Mental Age and Intelligence Quotient. (2022)

- **Intelligence** is the overall mental ability to learn, reason, solve problems, and adapt to new situations.
- **Mental Age (M.A.)** shows the level of mental development a person has reached, compared to average children of different ages.
- **Chronological Age (C.A.)** is the person's actual age in years.
- **IQ** is calculated as: $IQ = (M.A. \div C.A.) \times 100$.

- If M.A. equals C.A., IQ is 100 (average). Higher M.A. than C.A. gives IQ above 100 (above average), and lower M.A. gives IQ below 100.

9. As a school teacher, how can you identify attention fluctuations among your students? (2022)

- Observe if students look away, fidget, or lose eye contact during lessons.
- Notice slower responses or mistakes after a period of steady focus.
- Watch for daydreaming or distraction by outside noises/events.
- Ask quick questions during the lesson to check if students are still following.
- Use short breaks, activity changes, and interactive tasks to bring back lost attention.

10. Briefly explain the elements of Emotional Intelligence. (2022, 2024)

- **Self-awareness:** knowing and understanding one's own emotions.
- **Self-regulation:** managing and controlling emotional reactions.
- **Motivation:** using emotions to stay driven towards goals.
- **Empathy:** understanding and sharing the feelings of others.
- **Social skills:** managing relationships and communicating well with others.
- Together, these elements help a person handle emotions wisely in personal and social life.

11. Discuss the major components of creativity. (2022)

- **Originality:** producing new and unique ideas.
- **Fluency:** generating many ideas quickly.
- **Flexibility:** thinking of different approaches or categories of ideas.
- **Elaboration:** adding details to develop and improve an idea.
- **Sensitivity to problems:** noticing gaps, needs, or problems that others may miss.
- These components together allow a person to think in new and useful ways.

12. What is Anxiety? State the characteristics of Anxiety. (2022)

- **Anxiety** is a state of worry, nervousness, or fear, often about an uncertain outcome, such as an exam or new situation.
- **Characteristics:**
 - Feelings of tension, restlessness, or unease.
 - Physical signs like fast heartbeat, sweating, or shaky hands.
 - Difficulty concentrating or racing thoughts.
 - Can be mild (helpful, improves alertness) or severe (harmful, blocks performance).
- In students, moderate anxiety can improve focus, but high anxiety often lowers performance and learning.

13. Discuss the role of emotion in the education of a child. (2023)

- Positive emotions like joy and interest improve attention, memory, and willingness to learn.
- Negative emotions like fear or anxiety can block thinking and reduce performance.
- Emotional bonding with teachers builds trust and encourages participation.
- Emotional development also affects social skills, teamwork, and behavior in class.
- Teachers should create a warm, safe, and emotionally supportive classroom to help children learn and grow well.

14. Establish with example how 'Self-efficacy' and 'Anxiety' influence each other in education. (2023)

- **Self-efficacy** is a student's belief in their own ability to succeed at a task.
- **Anxiety** is the worry or fear a student feels, often about failing.
- High self-efficacy usually lowers anxiety — a student confident in exam preparation feels less nervous.
- Low self-efficacy raises anxiety — a student unsure of their ability feels more fear before a test.
- High anxiety can also lower self-efficacy over time, creating a negative cycle, while success and encouragement can break this cycle and build confidence.

15. Write how Anxiety and Curiosity affect student's motivation. (2024)

- **Anxiety:** mild anxiety can push a student to prepare and work harder (helpful), but high anxiety causes fear of failure, reduces confidence, and can lower motivation and performance.
- **Curiosity:** natural curiosity drives students to explore, ask questions, and seek knowledge, strongly boosting intrinsic motivation to learn.
- Teachers should keep anxiety at a healthy, low level while encouraging curiosity through interesting, open-ended activities to maximize motivation.

16. Briefly explain Maslow's Theory of Motivation. (2024)

- Maslow arranged human needs in a **pyramid**, from basic to higher needs:
 - Physiological needs (food, water, sleep)
 - Safety needs (security, stability)
 - Love/belonging needs (friendship, relationships)
 - Esteem needs (respect, confidence, recognition)
 - Self-actualization (reaching one's full potential)
 - Lower needs must be satisfied before higher needs become important.
 - In education, students with unmet basic or safety needs may struggle to focus on learning and growth.
-

GROUP C — 10 Marks Each (any 1 asked, ~300 words)

1. Define motivation. Discuss McClelland's Theory of (Achievement) Motivation and its classroom implications. (2020, 2023)

Motivation is the internal or external force that drives, directs, and sustains a person's behavior towards achieving a goal. It energizes action and determines the direction and intensity of effort.

David McClelland proposed that people are driven mainly by three types of needs:

- **Need for Achievement (n-Ach):** the desire to succeed, meet high standards, and accomplish challenging goals. People high in this need prefer moderately difficult tasks (not too easy, not impossible), want clear feedback on performance, and take personal responsibility for outcomes.
- **Need for Affiliation (n-Aff):** the desire for friendly relationships, social acceptance, and belonging. Such people prefer cooperative work and avoid conflict.
- **Need for Power (n-Pow):** the desire to influence, lead, or control others. This can be positive (leading for group benefit) or negative (dominating for personal gain).

According to McClelland, these needs are learned through life experiences and culture, not purely inborn, and one need is usually dominant in a person, guiding their behavior and career choices.

Classroom implications:

- Teachers should give students moderately challenging tasks to build achievement motivation, with clear and regular feedback on performance.
- Group activities and cooperative learning help satisfy the need for affiliation, especially for socially-oriented students.
- Giving responsibilities like class monitor or group leader roles can positively channel the need for power.
- Recognizing individual differences in dominant needs helps teachers motivate each student in the way that suits them best.
- Praise for effort and achievement builds confidence and encourages a healthy drive for success in the classroom.

In conclusion, understanding McClelland's theory helps teachers design tasks and a classroom environment that meets students' different motivational needs, improving engagement and performance.

2. Explain the different needs as mentioned in Maslow's theory. Mention any three educational implications of this theory. (2020)

Abraham Maslow proposed a theory of motivation based on a **hierarchy of needs**, arranged like a pyramid from basic to higher needs. A person is motivated to fulfil lower needs before moving to higher ones.

1. **Physiological needs:** basic survival needs like food, water, sleep, and rest.
2. **Safety needs:** security, stability, freedom from fear, and a safe environment.
3. **Love and belonging needs:** friendship, family, and a sense of connection and acceptance.
4. **Esteem needs:** self-respect, confidence, recognition, and respect from others.
5. **Self-actualization needs:** the desire to realize one's full potential, creativity, and personal growth — the highest level.

Maslow believed that a person cannot focus fully on higher needs (like learning or creativity) if lower needs (like hunger or safety) are unmet.

Educational implications:

- **Meet basic needs first:** schools should ensure students are not hungry, unsafe, or under stress, as these block learning. Mid-day meals and a safe school environment help meet physiological and safety needs.
- **Build belonging and esteem:** teachers should create a friendly classroom where students feel accepted, respected, and valued, boosting confidence and participation.
- **Support self-actualization:** once basic needs are met, teachers should give opportunities for creativity, choice, and personal growth — like projects, art, and open-ended tasks — to help students reach their full potential.

In conclusion, Maslow's theory reminds teachers that learning happens best when a student's basic emotional and physical needs are satisfied first, before expecting high motivation for academic growth.

3. Explain the 'operation' dimension of the SOI model. State any two educational implications of this model. (2021)

J.P. Guilford's **Structure of Intellect (SOI)** model explains intelligence as a combination of three dimensions: **Content** (type of information), **Product** (form the information takes), and **Operation** (the mental process used).

The **Operation dimension** refers to the different mental processes a person uses to handle information. Guilford identified five main operations:

- **Cognition:** the ability to understand, discover, and recognize information.
- **Memory:** the ability to store and recall information.
- **Divergent production:** generating many different ideas or solutions from given information (linked to creativity).
- **Convergent production:** finding the single best or correct answer to a problem.
- **Evaluation:** judging the correctness, suitability, or value of information or a decision.

These operations work together with content and product to make up the many separate abilities Guilford proposed exist in human intelligence.

Educational implications:

- Teachers should design activities that exercise **all types of operations**, not just memory-based recall – for example, giving open-ended, divergent thinking tasks (like "list all uses of a brick") builds creativity, while structured problems build convergent thinking.
- Assessment should go beyond memory tests and also measure evaluation and reasoning skills, helping identify each student's unique strengths across different mental operations, and allowing more personalized teaching.

In conclusion, the SOI model's operation dimension highlights that intelligence is not a single ability but a set of different mental processes, encouraging teachers to design varied learning activities that develop the whole range of student thinking skills.

4. Discuss Gardner's Theory of (Multiple) Intelligence with its educational implications. (2021, 2024)

Howard Gardner proposed the **Theory of Multiple Intelligences**, arguing that intelligence is not a single general ability but a set of several separate, independent abilities. He originally identified eight (later nine) types of intelligence:

- **Linguistic:** skill with words and language.
- **Logical-Mathematical:** skill with logic, numbers, and reasoning.
- **Spatial:** skill in visualizing and understanding space, shapes, and images.
- **Musical:** sensitivity to sound, rhythm, and music.
- **Bodily-Kinesthetic:** skill in using the body for movement and physical tasks.
- **Interpersonal:** skill in understanding and relating well to other people.
- **Intrapersonal:** skill in understanding one's own feelings and self.
- **Naturalistic:** skill in understanding nature, plants, and animals.
- **(Existential:** sensitivity to deep philosophical questions – sometimes added as a ninth type.)

Gardner believed every person has a unique mix of these intelligences, with some stronger than others, and that traditional IQ tests (mainly linguistic and logical) fail to capture this full range of human ability.

Educational implications:

- Teachers should use **varied teaching methods** – stories, music, movement, group work, and visual aids – so that students with different strengths can all learn effectively.
- Assessment should not rely only on written tests; projects, presentations, and practical tasks can better show a student's true abilities.
- Recognizing multiple intelligences helps identify and nurture talents in areas like art, sports, or social leadership, not just academics.
- It encourages an inclusive classroom where every student's strength is valued, boosting confidence and motivation.

In conclusion, Gardner's theory broadens the idea of intelligence beyond academics, encouraging teachers to design diverse, inclusive lessons that develop each student's unique combination of abilities.

5. Briefly discuss Weiner's Theory of Motivation. Mention the educational significance of Maslow's Theory of Motivation. (2022; see also standalone Weiner question below – 2024)

Weiner's Attribution Theory explains how people's beliefs about the *causes* of their success or failure affect their future motivation. Weiner said these causes are explained along three dimensions:

- **Locus:** internal (ability, effort) or external (luck, task difficulty).
- **Stability:** stable (ability) or unstable/changeable (effort, mood).
- **Controllability:** controllable (effort) or uncontrollable (luck).

For example, a student who believes failure was due to low effort (internal, unstable, controllable) is likely to try harder next time. But a student who believes failure was due to low ability (internal, stable, uncontrollable) may feel helpless and lose motivation. Teachers should encourage students to attribute results to effort and strategy, since these are changeable and within their control, building healthier motivation.

Educational significance of Maslow's theory:

- It reminds teachers that unmet basic needs (hunger, safety, insecurity) block learning, so these must be addressed first.
- It highlights the importance of building a sense of belonging and esteem in the classroom for students to feel confident and engaged.
- It encourages teachers to give opportunities for self-expression and creativity, helping students move towards self-actualization and reach their full potential.

Together, both theories guide teachers to understand *why* students behave the way they do and how to build lasting, healthy motivation for learning.

6. Explain Thurstone's Theory of Intelligence with its educational significance. How is this theory different from Gardner's Theory of Intelligence? (2022, 2023)

Louis Thurstone proposed the **Theory of Primary Mental Abilities**, stating that intelligence is not a single general ability but is made up of several separate, distinct abilities that work independently. He identified seven primary mental abilities:

- **Verbal comprehension:** understanding the meaning of words and ideas.

- **Word fluency:** ability to use words quickly and easily.
- **Number ability:** skill in handling numbers and simple calculations.
- **Spatial ability:** ability to visualize shapes and space.
- **Memory:** ability to recall information.
- **Perceptual speed:** ability to notice details and differences quickly.
- **Reasoning:** ability to solve problems and find rules or patterns.

Thurstone believed a person could be strong in some abilities and weak in others, and that no single "general intelligence" score can fully describe a person's mental ability.

Educational significance:

- Teachers should assess and support each mental ability separately, rather than relying on one overall intelligence score.
- Different subjects can be linked to different abilities (e.g., mathematics to number ability, reading to verbal comprehension), helping design focused teaching and remedial support.
- It supports differentiated teaching, since a student weak in one ability may be strong in another.

Difference from Gardner's theory:

- Thurstone's seven abilities are all **academic/cognitive** in nature (verbal, numerical, spatial, etc.), while Gardner's eight-plus intelligences include **non-academic** areas too, like musical, bodily-kinesthetic, and interpersonal intelligence.
- Thurstone's theory is based on statistical analysis (factor analysis) of test scores, while Gardner's theory is based on a broader range of evidence, including brain studies and cultural achievements.
- Gardner's theory is wider in scope, covering talents beyond the traditional classroom, while Thurstone's theory stays focused on core mental/cognitive abilities.

7. Discuss elaborately Weiner's Theory of Motivation. (2024)

Bernard Weiner's **Attribution Theory of Motivation** explains how a person's beliefs about *why* they succeeded or failed at a task affect their future motivation, emotions, and behavior.

According to Weiner, people commonly attribute their success or failure to four main causes: **ability, effort, task difficulty, and luck**. These causes can be understood along **three dimensions**:

- **Locus of control:** whether the cause is **internal** (within the person, like ability or effort) or **external** (outside the person, like luck or task difficulty).
- **Stability:** whether the cause is **stable** (does not change much, like ability or task difficulty) or **unstable** (can change, like effort or luck).
- **Controllability:** whether the cause is something the person **can control** (like effort) or **cannot control** (like luck or natural ability).

Effect on motivation and emotion:

- If a student attributes success to **effort** (internal, unstable, controllable), they feel proud and are motivated to keep trying.

- If a student attributes failure to **low effort**, they feel guilty but remain hopeful, since effort can be increased next time.
- If a student attributes failure to **low ability** (internal, stable, uncontrollable), they may feel shame and hopelessness, reducing future motivation — this can lead to "learned helplessness."
- Attributing failure to **external causes** (bad luck, unfair test) can protect self-esteem but does not encourage the student to improve.

Educational implications:

- Teachers should encourage students to attribute outcomes to **effort and strategy** rather than fixed ability or luck, since effort is controllable and changeable.
- Constructive feedback should focus on what the student did (effort, method) rather than labeling them as smart or weak.
- This builds a healthier, growth-oriented mindset, keeping students motivated even after failure.

In conclusion, Weiner's theory shows that it is not just success or failure itself, but *how a student explains* that outcome, which most strongly shapes their future motivation and self-belief.

Compiled from BSAEU B.Ed. 1st Semester question papers: 2020, 2021, 2022, 2023, and 2024 (Course 1.1.1, 2nd Half).
